In defense of vaccine passports

VIEWPOINT

BRYAN THOMAS AND COLLEEN M. FLOOD

THE Quebec government recently announced plans for a vaccine passport system which, in the event of a fourth wave of COVID-19, will bar people who are not fully vaccinated from entering indoor settings such as bars, restaurants, gyms, and entertainment events. Quebec is an outlier here: apart from Manitoba — which issues ‘immunization cards’ to those fully vaccinated but has not established any rules for their use — all other provinces have either rejected vaccine passports or remained silent on the issue.

The direct benefit of vaccine passports is clear: they would allow us to safely lift restrictions on indoor gatherings, with all the attendant benefits to the economy, culture, sports and education. They also incentivize people to get fully vaccinated.

So why are provincial governments generally opposed to the use of vaccine passports? The answer isn’t as clear or compelling as one might hope, given all that is at stake. In the early stages of vaccination rollout, there was a concern that marginalized populations would be overrepresented among the unvaccinated, and their marginalization would be compounded by vaccine passports. Whether this argument ever made sense is debatable — eschewing vaccine passports merely prolongs lockdown for

everyone, imposing economic costs shouldered disproportionately by marginalized populations. At any rate, these equity concerns have faded as vaccines have become readily available and, for the most part, equitably distributed.

It has also been argued that vaccine passports effectively coerce individuals to be vaccinated as a precondition of escaping pandemic restrictions, and that this violates the fundamental legal and

ethical right to autonomy over medical decisions. This argument fails for several reasons.

First, respect for patient autonomy does not entail that people should incur no costs whatsoever for their decision not to be vaccinated and share in the challenge of achieving herd immunity. It has long been the case that students who have not received routine MMR vaccinations can be kept out of the classroom, and that health care workers who refuse the flu vaccine can be denied work shifts during an outbreak.

Holding people down and vaccinating them against their will is a rights violation; turning unvaccinated people away from a gym or a movie theatre during a pandemic is not.

Concerns have also been raised as to the privacy implications of vaccine passports. As with most legal protections,

the right to health information privacy must admit of balancing with competing interests — and indeed health information privacy laws generally allow for public health exemptions.

Some lawyers and ethicists have worried that vaccine passports might become a tool of mass surveillance. But these are risks we can amply guard against. Vaccination passports could be no more intrusive, from a privacy perspective, than the requirement of showing photo ID at a bar, or carrying a driver's license when operating a motor vehicle.

A cynic might conclude that government opposition to vaccine passports is driven not by serious legal or ethical concerns, but out of a near-term political calculus: given all of the knee-jerk controversy surrounding vaccine passports, the safer option politically is to postpone their adoption for as long as possible. Ontario, for example, has just announced that it will not develop vaccine passports, and will instead focus on vaccination efforts — committing to lifting all restrictions once 80 per cent of the population has received one dose and 75 per cent have received two.

We need to recognize this for the need-less gamble that it is.

Other countries that have achieved high vaccination rates and lifted restrictions — such as the U.K. and Israel — are already seeing a resurgence of cases.

We need a sophisticated way to track what vaccines people have received, and when, so that we are equipped to respond to changes in disease virulence in a measured and proportionate manner. Setting one-time, arbitrary thresholds for vaccination is not a lasting solu-

tion.

At the very least, federal and provincial decisionmakers should be developing vaccine passport systems a fail-back option, rather than eschewing altogether in deference to resolvable concerns about equity, patient autonomy and health information privacy
